Implementation and Comparison of Minuscule ICCLMA with Minuscule Conformal Monopole Antenna

S. Rajeswari, C. Rekha

Abstract—In this paper, a high gain small size antennas such as minuscule ICCLMA (Inductively Coupled Capacitively Loaded monopole antenna) with minuscule conformal monopole antenna were designed and compared. These different types of antenna topologies were designed with same dimensions to produce higher gain. We begin with the comparison between the antenna designs, requirements and continue with a discussion issues and simulation results. In fact, each technique is uniquely designed to produce size reduction and higher gain antennas. Among two antennas the minuscule ICCLMA provides high gain is 45.2dB as compared to minuscule conformal monopole antenna. The simulation results are done by using CST Microwave Studio. The minuscule conformal monopole antenna reduces the cross polarization. The minuscule ICCLMA size is 3.393x0.0474mm while the minuscule conformal monopole antenna radius is 0.113mm.

Index Terms—Antenna radiation patterns, lumped elements, monopole antennas, vertically polarized antennas.

I. INTRODUCTION

In modern research on high gain small size antennas has been developed by an increasing interest in the use of wireless communication applications. For near ground communications [13] where both the transmit and receive antennas are placed near the ground is by many orders of magnitude lower than any other antenna orientation configurations [12]. Applications such as unattended ground sensors (UGS), vertically polarized antennas with omnidirectional radiation pattern are highly desired. As [16]-[17] the antenna size reduction is obviously major problem in wireless communication devices. Therefore several methods have been investigated for extremely short monopole antennas [2]-[3] with very high lateral dimensions, while maintaining high radiation efficiency. With the development of wireless communication devices and mobile phone technology [4]-[5], it has become significant to provide low profile antennas with omnidirectional radiation pattern [6]. There are various size reduction techniques used in the design of small antennas in which reactive inductive loading and reactive capacitive loading. In [7], electrically small antennas are further investigated and the performance such as impedance matching, the radiation pattern, the radiation efficiency, quality factor (Q), and polarization to be reported. In [8], the antenna is characterized with fractal geometries and the performance, it can be summarized that increasing the fractal dimension of the antenna leads to a higher degree of miniaturization. Applications of fractal geometry are becoming mostly used in the fields of science and engineering. Antenna miniaturization can generally be categorized into two methods are Miniaturizing the antenna topology using space filling compression technique and Antenna miniaturization using magneto-dielectric materials [9]. The spatial network Method [18]-[19] provides strong radiation with an omnidirectional pattern in the horizontal direction. The dielectric truncation [14]-[15] is not close to the source, and then the space wave power is unaffected. It gives better efficiency. For certain applications, where the bandwidth can be compromised, it is found that by a comprehensive analysis of a new wide bandwidth compact antenna called (WC) wide compact J-pole antenna provided 50% impedance bandwidth [10]. Although these exist many antenna miniaturization techniques [11], most of them cannot provide high gain. However it is difficult to implement in practice, because these antennas include a multilayer geometry. An extremely (LMMMA) low profile multi element miniaturized monopole antenna [20] based on superposition of multiple quarter-wave segments that are meandered and spiraled around to suppress the radiation from horizontal currents above the ground plane. The LMMMA produces purely vertically polarization which leads to lower gain. Recently, a low profile antenna called micro inductively coupled capacitively loaded monopole antenna (ICCLMA) [1] in which the techniques such as in-plane capacitive coupling, top loading, shorting pin achieve improved polarization purity and high gain with antenna miniaturization. The minuscule ICCLMA and minuscule conformal monopole antenna [21] were compared and the simulation results were obtained.

II. ANTENNA DESIGN

A. Minuscule ICCLMA

The proposed minuscule ICCLMA with three layers of total dimension is 3.393 x0.0474mm using CST. The vertical feeding pin and shorting pin were inserted in the middle and top layer respectively. The diameters of the pins were 0.5mm. In newly developed ICCLMA, the same equivalent circuit model is to be followed by changing the lumped elements values corresponding to their enlarged gain value. The inductors L1=5nH, L2=5nH were placed in the feeding pin and shorting pin respectively and the additional inductors are L3=1.9nH, L4=1nH were inserted in the top and middle layers respectively.
The shunt capacitor $C_1=0.788\text{pF}$ was placed in the metallic patch. Here the additional capacitors $C_2=1\text{pF}$, $C_3=1\text{pF}$ were inserted into the layers because the metallic trace is narrow. The resistor $R=1.5\Omega$ was inserted into the top layer.

The antenna dimensions (length and width) were calculated by using the formula as given by,

$$L = \frac{2a}{2} = 2\Delta L$$

$$L = 3.393\text{mm}$$

where $\Delta L$ denotes the dimension of the patch and $L$ denotes the actual length of the antenna.

$$\Delta L = 0.412h \left( \frac{\varepsilon_{reff}+0.1}{\varepsilon_{reff}+0.244} \right)$$

$$\Delta L = 1.69\text{mm}$$

where $h$ represents the height of the substrate. Width of the antenna is calculated by using the formula is given by,

$$W = \frac{f}{2f_0} \left( \frac{2}{\sqrt{\varepsilon_r+1}} \right)$$

$$W = 0.0474\text{mm}$$

where $\varepsilon_r$ represents the dielectric constant, $f$ represents the frequency range, and $C$ represents the velocity of light. The effective dielectric constant ($\varepsilon_{reff}$) is given by,

$$\varepsilon_{reff} = \frac{\varepsilon_r+1}{2} + \frac{\varepsilon_r-1}{2} \left[ 1 + \frac{12}{\varepsilon_r} \right]^{1/2}$$

$$\varepsilon_{reff} = 2.21$$

### B. Minuscule Conformal Monopole Antenna

The proposed minuscule conformal monopole antenna of radius is $0.113\text{mm}$ using CST. The design procedure for minuscule conformal monopole antenna is following. First the antenna is adapted to the cylinder. The cylindrical antenna is designed by the radius and height is $0.113\text{mm}$ and $0.0157\text{mm}$ respectively. Then the feed point is inserted to the cylindrical antenna. The feed point radius and height is given by $0.05\text{mm}$ and $0.0626\text{mm}$ respectively. The lumped elements such as resister $R=100\Omega$ and capacitor $C=1.5\text{pF}$ are connected between the cylindrical antenna and the feed point.

### III. SIMULATION RESULTS

I) We designed the minuscule ICCLMA topology using CST software and the corresponding simulation results were shown in below figure.

![Fig. 3. Simulated (a) Farfield directivity abs (Phi=90˚) and (b) Farfield axial ratio (Phi=90˚) in minuscule ICCLMA design.](image)

In the above figure 3 (a) shows farfield directivity absolute value at Phi=90˚. It provides the figure of eight radiation pattern. Here the frequency as 2.5GHz and the main lobe magnitude value as 316.0dB. Fig. 3(b) shows the farfield directivity axial ratio at Phi=90˚. The main lobe magnitude as 40.0dB. The gain of this minuscule ICCLMA is 45.2 dB.

directivity \(\text{Theta/phi (Phi=90°)}\) in minuscule ICCLMA design.

The corresponding farfield directivity theta at \(\text{Phi=90°}\) is shown by Fig. 4(a). It provides the figure of eight radiation pattern and the main lobe magnitude as 299.8dB, the main lobe direction as 88.0deg and the angular width as 92.6 deg. Fig. 4(b) shows the farfield directivity Theta/phi \(\text{Phi=90°}\). Here the main lobe magnitude as -2.5dB.

II) We designed the minuscule conformal monopole antenna using CST software and the corresponding simulation results were shown in below figure.

Fig. 5. Simulated (a) Farfield directivity abs (Phi=90°) and (b) Farfield axial ratio (Phi=90°) in minuscule conformal monopole antenna design.

In the above figure 5(a) shows farfield directivity absolute value at \(\text{Phi=90°}\). Here the frequency as 2.5GHz and the main lobe magnitude value as 7.4dB. Fig. 5(b) shows the farfield directivity axial ratio at \(\text{Phi=90°}\). It provides the omnidirectional radiation pattern. The main lobe magnitude as 40dB.

Fig. 6. Simulated (a) Farfield directivity theta (Phi=90°) and (b) Farfield directivity Theta/phi (Phi=90°) in minuscule conformal monopole antenna design.

The corresponding farfield directivity theta at \(\text{Phi=90°}\) is shown by Fig. 6(a). The main lobe magnitude as 7.4dB, the main lobe direction as 0.0deg and the angular width as 74.5 deg. Fig. 6(b) shows the Farfield directivity Theta/phi (Phi=90°). It provides the omnidirectional radiation pattern. Here the main lobe magnitude as 40dB. The gain of minuscule conformal monopole antenna is 1.06dB. The proposed minuscule ICCLMA provides higher gain as compared to the minuscule conformal monopole antenna.

IV. CONCLUSION

In this paper, implementation and performance comparison of minuscule ICCLMA and minuscule conformal monopole antenna were presented using CST and the radiation pattern performance of the E-plane and H-plane pattern are obtained. The minuscule ICCLMA topology provides better reduction in size, improved polarization purity and high gain as compared to minuscule conformal monopole antenna design. The reduced size of the minuscule ICCLMA and minuscule conformal monopole antenna are suitable for mobile radio communications, wireless communications.

ACKNOWLEDGMENT

I have taken efforts in this paper. However, it would not have been possible without the kind support and help of many individuals. I would like to extend my sincere thanks to all of them. I am highly indebted to Mrs. C. Rekha for her guidance and constant supervision as well as for providing necessary information regarding the project and also for her support in completing the paper. I owe a sincere prayer to the LORD ALMIGHTY for his kind blessings and giving me full support to do this work, without which would have not been possible. My thanks and appreciations also go to my colleague in developing the paper and people who have willingly helped me out with their abilities.
