How to Optimize Service Quality of City Bus in Bandung City

Septiana Hariya

Abstract: The rapid growth of the population affects the increase in the number of private vehicles, but the increase is not matched by the ability of public transport in providing good services related to security, safety, comfort, affordability, and equality. This study aims to evaluate the service performance of the city bus so that it could be seen improvements of the performance of urban bus service in Bandung. The method of analysis used in this research was Importance Performance Analysis (IPA). Based on the IPA performance of urban bus service still needs to be improved. There are several service attributes that become the main priority in improving the performance of the city bus service that is security, safety, comfort, affordability, and equality both for bus stop and bus.

Index Terms: Service-Quality, City-Bus, IPA (Importance Performance Analysis),

I. INTRODUCTION

Public transit buses in most urban areas are often considered to be a “greener” alternative to private vehicles (Eudy et al., 2014; Mahmoud et al., 2016; Wang, Y et al., 2017). The quality of public transport services is very important for the users of public transportation so that they still loyal to use the public transport (Ratanavara et al., 2016; Thompson and Schofield, 2007; Daniel, J. Margaret et al., 2018). Previous research by (Rojo, 2012), showed that relationship between service quality and demand for inter-urban buses influenced by variables affecting user satisfaction. Those variables were the duration of the journey, cost, and number of daily journeys.

Bandung is a metropolitan city and also as the capital city of West Java province republic Indonesia has public transportation mode one of the public transportation is the city bus. Based on Bandung Central Bureau of Statistics 2017, the number of vehicles in 2016 reached approximately 1.25 million units, 94% of which are private vehicles. Susanto (2014), said that the problem of congestion can only be solved by the public switching using public transportation so that the use of the road more effective. Public vehicles in Bandung Raya include City Transport (Angkot), Diesel Train (Kereta Rel Diesel/KRD), and City Bus. The city bus is one of the most publicly-chosen public transportation of 15,533,806 users in 2016 (Damri public company/Perum Damri) and can solve the congestion problem since the city bus has a large size so it can carry more passengers than other public transport and also the cost which is relatively cheap ie between Rp 3000 - Rp10000.

According to Damri public company City Bus Units (Unit Angkutan Bis Kota) Bandung, since 2004 the city of Bandung has two types of city bus that is Bus Damri which began operating in 1978 and Trans Metro Bandung which operated in 2004. Until now in 2017 there are 13 routes passed by in the Bandung city.

The performance of city bus can be seen from the service and its operation. According to Herdiana, Sony (2012) evaluation of Transport Service Performance Damri Bandung Based on the Perception of Users and Managers, the level of service level of Damri bus transportation in Bandung City such as security, tariff, travel time, and convenience. Low service levels can include inadequate facilities and infrastructure, prolonged travel time, number of passengers exceeding transport capacity, low level of comfort, inadequate network systems, difficult accessibility to certain areas, etc. (Dwiryanti and Ratnasari, 2013).

Building upon the previous research, this study aims to study service quality city bus.

II. PROBLEM STATEMENT

Service Performance Damri Bus Transport Bandung Based on Perceptions of Users and Managers, the level of service levels Damri bus transport in the city of Bandung such as security, rates, travel time, and convenience. Low service levels can include inadequate facilities and infrastructure, long travel time, number of passengers exceeding transport capacity, low level of comfort. Seeing the many problems that exist in City Bus in Bandung, it is necessary to study service quality city bus, so city bus could be a solution for traffic problems and could increase the number of passengers public transport.

III. THE AIM OF RESEARCH

Building upon the previous research, this study objective was to measure the service quality of city bus.

IV. METHOD OF RESEARCH

This research is conducted in Bandung City, West Java, Indonesia. Sample method used to know the passenger city bus in Bandung City. Slovin method used to take sample of passenger city bus (Sevilla, 1993 and Hariyani, 2017).

Where:
\[ N = \text{number of population} \]
\[ n = \text{sample} \]
\[ e = \text{margin of error (this study used } e = 10\%) \]

The calculation using the above formula result to the number of the sample is 100 respondents. Where the number of population or passenger city bus in 2017 is 15,533,806 and e=10%.
To determine the factors that influence city bus's level of service in Bandung City using Importance Performance Analysis (IPA) (Martilla, 1977; Supranto, 2006; Arraningrum, 2013; Hariyani, 2017). IPA is an analytical tool used to compare performance and satisfaction felt by customers compared to the desired level of satisfaction. To assess the city bus's level of service use 45 attributes as shown in the Table 1. The attributes that were examined were measured using a Likert scale. Likert scale is ordinal measurement scale consisting of five levels and is weighted according to its level. IPA method requires the usage weighing both for level of satisfaction and level of importance, so that each attributes above was weighted. The weighing consist of 5 values which are 5 = very satisfied/very important; 4 = satisfied/important; 3 = fairly satisfied/ quite important; 2 = less satisfied/less important and 1 = not satisfied/not important. The relationship between the level of interest and the performance perceived by the customer illustrated in the diagram of Importance Performance Analysis as in Figure 1.

IPA is presented in a diagram consist of four quadrants which are:

1. Quadrant one meaning "Concentrate Here" (high importance and low satisfaction). Factors located in this quadrant is considered as very important factors for consumers, but the conditions is not satisfied. Factors located in this quadrant is a priority for improvement.

2. Quadrant two meaning "Keep up the Good Work" (high importance and high satisfaction). Factors located in this quadrant are considered as additional factors for customer satisfaction so that the management is obliged to ensure that the performance of the institutions under its management needs to continue to maintain the achievements.

3. Quadrant three, "Low Priority" (low importance and low satisfaction). Factors located in this quadrant have a low level of satisfaction and at the same time is not considered too important for the consumer, so that the management does not need to prioritize or paying much attention to these factors.

4. Quadrant Four, "Possible Overkill" (low importance and high satisfaction).

V. ANALYSIS AND DISCUSSION

Based on IPA analysis, the cartesian diagram consists of four quadrants can be seen in Figure 2. Here is a description of each of the attributes for both the bus and the bus stop attribute, which enter each quadrant.
How to Optimize Service Quality of City Bus in Bandung City

Quadrant 1 Concentrate Here
Attribute Bus stop: Attribute number 20 lighting, number 23 clean from garbage, number 24 trash can, number 34 distance between bus stops, number 35 dedicated difabel path.

Quadrant 2 Keep up the good work
Attribute Bus:
Attribute number 4 vehicle identity, number 7 lighting conditions, number 15 glass-breaking hammer, number 16 condition brake, number 19 brake light conditions, number 27 lighting, number 29 air conditioning, number 30 trash can, number 31 passenger density, number affordable price, number 38 inter bus time, number 39 travel time of the bus, number 41 departure schedule, number 45 information board.

Attribute Bus Stop
Attribute number 33 feeding mode.

Quadrant 3 Low Priority
Attribute Bus:
Attribute number 1 lighting conditions, number 2 security guard, number 3 security information, number 10 traffic and transport equipment, number 11 pelican lamp, number 12 good pelican lamp condition, number 13 fire extinguisher.

Attribute Bus Stop:
Attribute number 5. driver’s identification, number 8 security guards, number 21 ventilation/air conditioning, number 25 plants around the bus stop.

Quadrant 4 Possible over kill
Attribute Bus:
Attribute number 6 alarm signal, number 9 condition window film, number 14 Fire extinguisher, number 28 transport capacity.

Attribute Bus stop: attribute number 22 condition of ventilation/AC, number 26 passenger density.

Based on the results of IPA, the main priority attributes that need to be improved could be seen in Table 2.

VI. CONCLUSION

Based on the results of IPA analysis, it was found that the performance of urban bus service in Bandung city has to be improved the service quality. There are several service attributes that are the top priority in improving the performance of the city bus service that is security, safety, comfort, affordability, and equality. Improving the service performance of the city bus is a top priority of the city government, in order to attract more passengers to use the city bus as a mode of transportation.

VII. ACKNOWLEDGEMENTS

The authors also would like to express their deepest thanks and appreciation to undergraduate students namely Birahma Titis A, Fahrizky Tiara P, Gema Iftithah, Laras Nikita S, M. Alvian A, M. Naim Agista W, Umar Ubaidillah, and Valisha Nabila, who participated in surveys and data compilations.
