Convergence and Extended Linear Generating Function for Generalized Hypergeometric Function

N. Srimannarayana, B. Satyanarayana, D. Ramesh

Abstract: The subject of Special functions has a lot importance during the last few decades. The intend of this work is to test the convergence and to introduce the extended linear generating relation for the generalized hypergeometric function. The result is followed by its applications to the classical polynomials.

Index Terms: Generalized Hypergeometric polynomial, Hypergeometric polynomials modified Jacobi polynomial, Laguerre polynomial.

I. INTRODUCTION

Many of the special functions like Laguerre, Hermite, Legendre and Konhauser polynomials has several applications in mathematical physics and statistics. Few decades onwards many researchers gave their generalizations, extensions and related properties like generating functions, recurrence relations and solved some of the integrals using these functions. Previously in the paper [1], we defined a class of generalized hypergeometric function $B^p_{n}^{(\alpha,\beta)}(x,y,w)$ defined as follows:

$$B^p_{n}^{(\alpha,\beta)}(x,y,w) = \frac{\Gamma(n + \alpha + 1) \Gamma(n + \beta + 1)}{n!} \times \sum_{r=0}^{n} \frac{(-1)^{r} y^{[n]} J_{n,r}^{(\alpha)}(x,w)}{r \Gamma(n + \alpha - r + 1) \Gamma(r + \beta + 1)}$$

where $J_{n,r}^{(\alpha)}(x,w)$ is modified Jacobi polynomial which has been defined by using difference operator technique [3] (see Parihar and Patel [7] and also see Lahiri and Satyanarayana [4]-[6]). Also it has been derived the hypergeometric representation of (1) as see [10]

$$B^p_{n}^{(\alpha,\beta)}(x,y,w) = \frac{(1 + \alpha)_n (1 + \beta)_n}{(n!)^2} \times \sum_{r=0}^{n} \sum_{s=0}^{r} \frac{(-n)_r (r-s-w)_s (w)_r}{r! s! (1 + \alpha)_s (1 + \beta)_r}$$

which has been modified by using difference operator technique [3] (see Parihar and Patel [7] and also see Lahiri and Satyanarayana [4]-[6]). Also it has been derived the hypergeometric representation of (1) as see [10]

$$B^p_{n}^{(\alpha,\beta)}(x,y,w) = \frac{(1 + \alpha)_n (1 + \beta)_n}{(n!)^2} \times \sum_{r=0}^{n} \sum_{s=0}^{r} \frac{(-n)_r (r-s-w)_s (w)_r}{r! s! (1 + \alpha)_s (1 + \beta)_r}$$

where $J_{n,r}^{(\alpha)}(x,w)$ is modified Jacobi polynomial which has been defined by using difference operator technique [3] (see Parihar and Patel [7] and also see Lahiri and Satyanarayana [4]-[6]). Also it has been derived the hypergeometric representation of (1) as see [10]

$$B^p_{n}^{(\alpha,\beta)}(x,y,w) = \frac{(1 + \alpha)_n (1 + \beta)_n}{(n!)^2} \times \sum_{r=0}^{n} \sum_{s=0}^{r} \frac{(-n)_r (r-s-w)_s (w)_r}{r! s! (1 + \alpha)_s (1 + \beta)_r}$$

where $J_{n,r}^{(\alpha)}(x,w)$ is modified Jacobi polynomial which has been defined by using difference operator technique [3] (see Parihar and Patel [7] and also see Lahiri and Satyanarayana [4]-[6]). Also it has been derived the hypergeometric representation of (1) as see [10]

$$B^p_{n}^{(\alpha,\beta)}(x,y,w) = \frac{(1 + \alpha)_n (1 + \beta)_n}{(n!)^2} \times \sum_{r=0}^{n} \sum_{s=0}^{r} \frac{(-n)_r (r-s-w)_s (w)_r}{r! s! (1 + \alpha)_s (1 + \beta)_r}$$

By considering the limit $w \to 0$, $\beta = 0$, $y = 0$ and $w \to 0$, $\alpha = 0$, $x = 0$ and $w \to 0$ in (2), it leads to the following special cases

$$L^p_{n}^{(\alpha,\beta)}(x,y) = \frac{(1 + \alpha)_n (1 + \beta)_n}{(n!)^2} \times \sum_{r=0}^{n} \sum_{s=0}^{r} \frac{(-n)_r (r-s-w)_s (w)_r}{r! s! (1 + \alpha)_s (1 + \beta)_r}$$

where $L^p_{n}^{(\alpha,\beta)}(x,y)$ is Laguerre polynomial of two variables defined by Ragab, S.F. [8]. By writing $\beta = 0$, $y = 0$ and taking $w \to 0$ in (2), it reduces to

$$L^p_{n}^{(\alpha,0)}(x,0,w) = L^p_{n}^{(\alpha)}(x)$$

where $L^p_{n}^{(\alpha)}(x)$ is Laguerre polynomial, Rainville, E.D.[9]. By writing $\alpha = 0$, $x = 0$ and taking $w \to 0$ in (2), it reduces to

$$L^p_{n}^{(0,\beta)}(0,y,w) = L^p_{n}^{(\beta)}(y)$$

where $L^p_{n}^{(\beta)}(y)$ is Laguerre polynomial, Rainville, E.D.[9]. The generating function of the form given by A.K.Agarswal and H.L.Manocha[1] is useful for obtaining the bilateral and trilateral generating relations for the generalized hypergeometric functions and is as

$$\sum_{n=0}^{\infty} A_{m,n} S_{m+n}(x) t^u = \frac{f(x,t)}{g(x,t)} S_m(h(x,t))$$

II. CONVERGENCE FOR $B_n^{(\alpha, \beta)}(x, y, w)$

On account of (1), it can be obtained

$$B_n^{(\alpha, \beta)}(x, y, w) = \sum_{r=0}^{n} \frac{(-n)_r (-(\frac{y}{w})_r (-w)_r)}{r! (1 + \beta)_r} A_{n,r}$$

where

$$A_{n,r} = \frac{(1 + \alpha)_n (1 + \beta)_n}{(n!)^2} \binom{n}{r} \binom{1 + \beta}{r}$$

Here $A_{n,r}$ is a polynomial and hence convergent.

$$\lim_{r \to \infty} \left[ \frac{(-n)_r (-(\frac{y}{w})_r (-w)_r)}{r! (1 + \beta)_r} \right] = \lim_{r \to \infty} \frac{(-n+r)(-(\frac{y}{w})_r (-w)_r)}{(r+1)(1 + \beta)_r}$$

Now, let $s = \lim_{r \to \infty} \frac{A_{n,r+1}}{A_{n,r}}$. Thus, it can be concluded that the given function is convergent if $|w_1 x| > 1$ i.e., $|w_1| > 1$ and divergent if $|w_1 x| < 1$ i.e., $|w_1| < 1$. Moreover, if $|w_1 x| = 1$, then it can be proceeded as follows:

Let $\delta = \frac{1}{2} \text{Re} (\frac{y}{w} + 1 + \beta + n) > 0$ and by comparing the terms of the series.

$$B_n^{(\alpha, \beta)}(x, y, w) = A_{n,0} + \sum_{r=1}^{n} \frac{(-n)_r (-(\frac{y}{w})_r (-w)_r)}{r! (1 + \beta)_r} A_{n,r}$$

with the corresponding terms of the series $\sum_{r=0}^{\infty} \frac{1}{r^{1+\beta}}$, which is known to be convergent, the following can be obtained

$$\lim_{r \to \infty} \left| \frac{r^{1+\delta} (-(n)_r (-\frac{y}{w})_r)}{r! (1 + \beta)_r} A_{n,r} \right|^2 = 0$$

where $\lim_{r \to \infty} |A_{n,r}| = \rho$, is finite. Thus,

$$\text{Re} (\frac{y}{w} + 1 + \beta + n - \delta) = 2\delta - \delta = \delta > 0$$

So, as the function (1) is convergent, one may get the different type of integrals, integral transforms like Laplace, Millen and Eugler-Beta for the same.

III. EXTENDED LINEAR GENERATING RELATION

Now, we prove the following extended generating relation for the generalized hypergeometric function (1).

Theorem 5 : \[
\sum_{n=0}^{\infty} \frac{(m+n)!}{n!} B_n^{(\alpha, \beta)}(x, y, w) T^n (n+m)! = \sum_{n+r=m} \binom{n+r}{r} \frac{J_n^\alpha(x, w) w^r}{r! (1 + \alpha)_n (1 + \beta)_r}
\]

Proof : The proof of (11) can be developed easily from (1) in the following way

Consider the double series

$$\sum_{m=0}^{\infty} \frac{(m+1)!}{m!} B_n^{(\alpha, \beta)}(x, y, w) T^n (n+m)! = \sum_{m=1}^{\infty} \sum_{n=0}^{\infty} \frac{(m+n)!}{n!} B_n^{(\alpha, \beta)}(x, y, w) T^n (n+m)!$$

and on replacing ‘n’ by ‘(n-m)’ and using Satyanarayana and others[10, pp.263(3.2)], we obtain

$$= \sum_{m=0}^{\infty} \frac{J_n^\alpha(x, w) w^r}{r!} \sum_{n=0}^{\infty} \frac{(m+n)!}{m! (n+r+y-m)!} \frac{T^n (n+r+y-m)!}{(n+r+y-m)!}$$

3578
\[ \sum_{m=0}^{\infty} u^{m} \sum_{n+r+v \geq m} \frac{(n+r)!(n+r+1)v}{(n+r-m+1)v} t^{n+r-m} \left( -\frac{y}{w} \right)^{r} J_{n}^{m}(x, w) w^{r} t^{v} \]

\[ \times r! v! m!(n+r-m)!(1+\alpha)_{n}(1+\beta)_{r} \]

\[ \sum_{m=0}^{\infty} u^{m} \sum_{n+r+v \geq m} \frac{n+r+c_{n} t^{n+r-m} \left( -\frac{y}{w} \right)^{r} J_{n}^{m}(x, w) w^{r}}{(1+\alpha)_{n}(1+\beta)_{r} r!} \]

\[ \times \mathbf{F}_{1} \left[ \begin{array}{c}
n + r + 1 \\
n + r - m + 1; \end{array} \right] \]

IV. EXPERIMENTAL RESULTS

Case 1: If \( m = 0 \), the above result leads to

\[ \sum_{n=0}^{\infty} n! B_{n}^{(\alpha, \beta)}(x, y, w) t^{n} \]

\[ = e^{y} \mathbf{F}_{1} \left[ \begin{array}{c}
\frac{y}{w}; 1 + \beta; wt \\
\frac{x}{w}; 1 + \alpha; - wt 
\end{array} \right] \]

which is the known result by Satyanarayana and others[10, pp.263(3.2)]

Case 2: If \( m = 0 \) and by taking \( w \to 0 \) on both sides of the above result, we get the known result by S.K. Chatterjea[11]

\[ \sum_{n=0}^{\infty} n! L_{n}^{(\alpha, \beta)}(x, y) t^{n} \]

\[ = e^{y} \mathbf{F}_{1} \left[ \begin{array}{c}
-1 + \alpha; - xt \\
-1 + \beta; - yt 
\end{array} \right] \mathbf{F}_{1} \left[ \begin{array}{c}
-1 + \alpha; \\
-1 + \beta; 
\end{array} \right] \]

V. CONCLUSION

This work has tested the union of the function (1) and obtained extended generating relation with application as special cases. By using the this extended linear generating relation, one may get the extended bilinear and bilateral generating associations through classical and generalized hypergeometric functions. By taking those bilateral generating functions, obtain very easily the integrals of the product of the functions which are useful in some of the engineering problems and also in mathematical physics.
