Development of Self-Explanation Prompt in i-Fractions

Ummu Husna Azizan, Nor Zuhaidah Mohamed Zain Shamsul Arrieya Ariffin

Abstract: The purpose of this study is to design a self-explanation prompts or help element in iFractions educational game software. The self-explanation prompts was developed using the cartoon concept. In the previous research students who used the self-explanation prompts showed significantly better achievements. Students who used iFractions with self-explanation prompts found that it has helped them make the fractions abstract concept concrete and facilitate the proper construction of fractions schema. Therefore, the design of any educational software must be constructive in parallel with the combination of scaffolding element which is the self-explanation prompts.

Keywords: Self-explanation prompts; cartoon concept; fractions

I. INTRODUCTION

Fractions is a very difficult topic for school children (Gabriel et.al., 2013; Forgues, Tian and Siegler 2015; Tian and Siegler 2016; Emily Sharp and Dennis, 2017). This occurs since students cannot construct a proper fractions schema due to the confusion that arises when learning the topic of Round Numbers. Hence, previous researchers have developed various teaching aids to solve problems that arose in learning fractions. One of the teaching aids developed by previous researchers was an educational software in the form of games and non-games. However, the software developed had many weaknesses in terms of assistance to low ability students. MdSalleh and Napiah (2010) have developed a fractions educational software to improve students’ performance in fractions. However, this software was not flexible for students with different levels of ability because the help element was not available.

Wan Fatimah and NurulHidayah (2010) have also developed the fractions educational game software that contained tutorials on fractions. The help element was also not provided in this software. The Ministry of Education Malaysia(MOE) has also distributed the educational software, that is the MyCD course software for Year 1 to Year 4 students; containing text, animation, audio, video, interactive activities and interactive tests to support and enhance text book contents (Muhammad, 2009).

II. SELF-EXPLANATION PROMPTS

The self-explanation prompts is defined as generating self-explanations in order to understand the information learned (Johnson, Loehr and Durkin, 2017; Chi, 2000). According to Chi, Olffman and Berger (2017), self-explanation is an effective metacognitive strategy that can help students develop deeper understanding since the self-explanation prompts emphasises on production of conclusions to bridge the information gap in learning materials (Sernlai, Spottl and Straka, 2011) and can be used to support multimedia learning (Lijia Lin et. al, 2014).

Studies show that students who are often motivated to carry out self-explanation related to learning materials perform better than students who are not motivated to do self-explanation (Chi, Olffman and Berger, 2017; Rittle-Johnson and Loehr, 2016; Mayer, Dow and Mayer, 2003; Wong, Lawson, and Keeves, 2002). Most students do not do self-explanation spontaneously but begin to self-explain when guided (Bielaczyc, Pirolli, and Brown, 1995) or when motivated to do so (Chi, DeLeeuw, Chiu, and LaVancher, 1994).

According to Rittle-Johnson (2006), students who are not motivated to do self-explanation will return to using their wrong procedure or understanding. Self-explanation prompts can be carried out through ‘thinking-aloud’ (talking) or covertly (thinking). According to Roy and Chi (2005), Chi et al. (1989) and Nokes, Hausmann and Van Lehn (2011), self-explanation prompts can play a role in two forms, that is generating conclusions to fill up the missing information (gap-filling) and the mental-model revision.
Gap-filling is designed to fill in the information gap in such learning while mental-model revision is the driving force that focuses on students to review their existing knowledge. Studies done by Lijia Lin et. al (2014) found that self-explanation prompt can improve students’ performance while reducing the students’ cognitive burden. This statement is supported by O’Neil et. al. (2014) where he found that self-explanation prompt could help students in the process of playing educational software games.

Cartoon Concept

One of the techniques to create self-explanation prompts is by using cartoon concept which it is used as a stimulus to questions, triggers discussion and generate scientific thinking by assessing existing students' knowledge of certain concept including competing views or explanations of certain phenomena (Long danMarson, 2003; Song, Heo, KrumenakerdanTippins, 2008). Cartoon concept has features such as visual representation of scientific ideas, minimal texts in the form of dialogue, alternative views in every situation, scientific ideas are applied in everyday situations and accepted scientific views and alternative views will be added together (Keogh dan Naylor, 1999).

Cartoon concept is very effective in student learning where it involved students in scientific dialogue to explore scientific concepts (Song, Heo, KrumenakerdanTippins, 2008; Sexton, Gervasonidan Brandenburg, 2009). Student are required to consider the views expressed and determine the views they support and why they support such views (Keogh dan Naylor, 2000).

Cartoon concept involves students in discussion by presenting some alternative views by cartoon characters in which this will cause a debate among students. The alternative views provided include acceptable scientific ideas and the common misconceptions that students have in daily learning. The debate arises when students oppose ideas and disagree with the views given by the cartoon characters (Chin danTeou, 2009). Through cartoon debates and alternatives views, existing students knowledge will be combined with new knowledge to reconstruct their incorrect learning scheme and facilitate the formation of mental models. When a student has a strong mental model, this can help to improve student achievement. An example of cartoon concept design is shown in Figure 1.

Development of Self-Explanation Prompts in iFractions

Self-explanation prompts in iFractions are designed using cartoon concept. The cartoon concept applied the use of a bunch of cartoon characters that dialogue through the use of minimal texts (Sexton, Gervasonidan Brandenburg, 2009). The self-explanation prompts that were developed in iFractions consists of meta-cognitive self explanation prompt and justification prompts which are based on three types that is teacher, friends and facebook as in Figure 2.

Examples of cartoon concepts used in iFractions development are shown in Figure 3, Figure 4 and Figure 5. Cartoon concept that applied in the development of meta-cognitive and justification self-explanation prompts involve cartoon characters that are currently discussing about fraction comparison problem that consist of correct and incorrect views and solutions.
These cartoon characters arouse debates and arguments among students if they have conflicting ideas and disagree with their views (Chin dan Teou, 2009). Students existing views and concepts will be adapted to the new knowledge received from the debate. Restructuring of the concepts will occur if the student existing concept is wrong or unacceptable until the students can form the correct fraction scheme.

### III. CONCLUSION

Self-explanation prompts is effective especially for low ability students in improving their fractions achievements. The iFractions educational game software can trigger self-explanation among students as a software environment that encourages and assist students to begin their own self-explanation process among themselves. This is because according to Bielaczyc, Pirolli, and Brown, (1995), most students do not begin the self-explanation process spontaneously unless they are assisted to begin the process of self-explanation or are encouraged to do so (Chi, DeLeeuw, Chiu, & LaVancher, 1994). Due to the weak existing knowledge of students, self-explanation prompts helps activate existing knowledge of students by creating a phenomenon that can trigger conceptual conflicts through different perceptions (Clark, 2008). Different perceptions can create dissatisfaction with the old concept existing in the cognitive structure. In accommodating this, students will alter the concept of inaccuracy with the new phenomenon encountered. The self-explanation prompts developed in this game software helps students in constructing the correct fractions schema by creating perceptions different from the students’ perceptions.

### ACKNOWLEDGEMENT

This paper is based on the research project entitled 'Rekabentuk Pendorong Penerangan Kendiridalam Permainan Pendidikan iFractions'. The authors would like to extend their gratitude to the Research Management and Innovation Centre (RMIC), Sultan Idris Education University (UPSI) for the University Research Grants (code: 2016-0056-109-01) that helped fund the research.
