# Culture and Personality: A Examination of Impulsive Buying Behavior of Indian Consumers

# Nishtha Bhushan, Bhawna Agarwal

Abstract: The leading objective of this paper is to unearth the influence of culture and personality of Indian consumers on their impulsive buying behaviour. A lot of research has been done to study the influence of external stimuli like advertisements and in-store promotions on consumers' buying behaviour. This paper studies the influence of internal stimuli on impulse buying behaviour. Impulse buying is an unplanned buying or accidental behaviour of consumers. This paper tries to establish a relationship between different personality traits and accidental behaviour of consumers. The impact of Big Five personality traits and culture (Individualism and Collectivism) on the impulsive buying behavior is studied. Data has been collected from consumers using structured questionnaire on a five-point Likert's scale. The data would be analysed through various statistical tools using SPSS.

Keywords: Impulse Buying Behavior, collectivism and individualism, personality

# I. INTRODUCTION

The market in India has very fast because of economic growth. stands third only after China and Brazil in Net Sales.India has reached an all-time high in terms of per capita availability of retail India's retail sector is experiencing exponential The dynamic growth. ever demographic profile, swelling urbanization, varyingconsumer tastes preferences have been driving the growth in the organized Indian retail markets. India is the fifth destination in the According to "A T Kearney 2016, Global Retail **GDP** Development Findings", growth, doing business, and better clarity foreign direct investment (FDI) have put the second place in 2016 Global Retail Index.Indian retail market Development reach US \$1 trillion 2020 to essentially due to rise in income, urbanization shifts and in behavior of consumers. Retail beenconsiderablymotivated demand has escalating middle class urbanization, ever more and more women entering the workforce.

Engel et al (1978)explains unplanned purchasing for a purchasing action was accepted with no problem having been formerly beenacknowledged or a purchasing goal formed before entering the Piron(1993)defines proposed buy specific opposite of unplanned andconceptualized planned buy for a purchasing action undertaken using difficulty having а beenformerly recognized or a purchasing intention formed before to entering the shop. In entirety, urge although all buys are bond purchases, fanatical however all purchases aren't allcreated impulse. Piron suggests buys, intended, unplanned or left on impulse could (i.e. experiential accompanied psychological by and/or cognitive responses) or non-experiential. Impulsebuying can "a surprising and strong desire purchase instantly" andhappens every time customer purchases a product that the customer purpose ofbuying before going into buying **Impulse** could be prejudiced byoutside purchase incitements like store attributes and pleasure promotions, internal stimulation like self-identity, Societal and merchandise related factorslike time and cash available, and demographic and sociological things like sex, and schooling.

study The achieved by Nielsen International indicates that roughly 72 percent of FMCG buys projected, but 28% of grocery either unplanned or impulse buys. TheTop Rated unplanned purchases from the food class are sweets, chocolates, snacks, frozen desserts and with also the snacks along Top Rated unplanned buys in the non-food class aremakeup, hand/body air-fresheners, toothbrushes, soaps creams.

#### Individualism and Collectivism

"Based Lee and Kacen (2000),collectivist respondents were some what wealthier theirurge buy as it had been created relative whereas presence of friend or a respondents individualist wereboth pleased impulse buys if they left purchases with somebody. They reached civilization affects decision which consumers' buying behaviours.

According to Triandis (1994), each person takes both individualist and collectivist inclinations, the sole difference beingthat in certain civilizations, the probability of individualist attitudes, values and behaviours being present could be higher/ In compared to others. individualist lower cultures, most individuals are just worried about themselves or their immediate householdwhereas collectivist cultures, individuals belong manage everyone around. They're classes and worried about everybody connected together. They team. Triandis (1995)described а individualism as a societal arrangement comprising those that are autonomous and independent whereas he described collectivism asa societal pattern comprising those who believe themselves as a substantial portion of classes, such as family or coworkers. Thesesocietal structures affect spontaneous purchasing behavior. India has an intermediate score of 48 (Geert Hofstede), thus, India is a society with both individualist and collectivist traits".

#### **Personality**

"Kollat and Willet (1967)examined the association between personality traits and impulsive buying behaviour but did not show any significant differences. Shahjehan et al.(2012) examined that consumers with anxiety, emotional instability, moodiness and sadness were more likely to be indulged in impulsive buying. The dimensions of personality traits developed by Sofi and Nika (2017) were used in this study, namely: expressive, emotional stability, sociableness, conscientiousness, pleasure seeking personality and conserving propensity. Verplanken and Herabadi revealed that the impulsive propensity is strongly entrenched in personality traits of a consumer".

The personality traits studied in this paper are:

\* "Pleasure Seeking Personality: They are individuals who would like to learn novel things, enjoy new experiences and usually notch high in openness.

- \* Conscientiousness: They are the ones with high degree of conscientiousness, reliability and promptness. They are organised and organized and thorough with almost everything.
- \* Expressive: These Individuals get their energy from interacting with others. They are energetic, talkative, and assertive.
- \* Sociableness: These individuals are friendly, cooperative, and compassionate. People with low agreeableness may be more distant. They are kind, affectionate, and sympathetic.
- \* Emotional Stability: This dimension relates to one's emotional stability and degree of negative emotions. Individuals who score low on emotional stability often experience emotional instability and negative emotions. They have mood swings and areoften tense".

#### II. LITERATURE REVIEW

Several studies have been conducted in the past to explore the impulsive buying behavior of consumers.

"Sofi and Nika (2017) investigated the influence of personality on impulsive buying behavior. The results reveal that personality has a significant positive (affection) and negative impact on (cognition) indicators of impulsive buying. All the determinants of personality significantly determine the personality of an individual and personality determines impulsive buying as both positive and negative indicators of impulsive buying significant. Higher the degree of cognition, lower would be buying tendencies as its coefficient is negatively significant. Three attributes including expressive propensity, pleasure seeking propensity, sociableness, are positive indicators tendencies, impulse buying whereas conscientiousness, conserving propensity, and emotional instability are negative indicators of impulsiveness".

"Leela Reddy (2015)explore and the relationship between impulsive buying demographic variables of consumers in Hyderabad and Bangalore. The younger crowd shows a preference for promotional activities, trying new recent advertisements. products and consumers indicated a preference for low price products and discount offers. Male consumers try new and innovative Occupation and income have a strong influence on impulsive buying behaviour".

"Bhatti and Latif (2013) researched regarding the association between impulse buying and visual merchandising on buying behavior of customers. The results suggested that window display, forum floor merchandising and shop name (independent variables) are significantly associated to consumer impulse buying behavior Window display, floor (dependent variable). merchandising and shop brand name related impulse buying behavior positively of consumers whereas forum display is negatively related to consumer impulse buying".

"Lee and Kacen (2008) studied the impact of culture (individualist and collectivist consumers) and the presence of another person at the time of purchase on consumers' planned and impulse purchase decisions. They collected data from four (USA, Australia, Singapore countries Malaysia) using a survey about a recent impulse and a recent planned purchase decision. study used a 2 (purchase type: impulse versus planned) X 2 (purchase situation: alone versus with an important other) X2 (cultural region: individualist versus collectivist) X 2 (order:

impulse first versus planned first) mixed factorial design and thus, four versions of

questionnaires were formulated to collect from 706 respondents about their recent impulse and planned purchase when they were with important or when they were alone. The results reveal that consumers from collectivist countries were more satisfied with their impulse purchase when they were with an important versus when they were alone at the time of consumers from individualist purchase; whereas countries showed difference in satisfaction no between these purchase situations. two another person influenced neither presence collectivists nor individualists for planned purchases".

"Bourlakis, **Mamalis** and Sangster (2005)studied the factors impacting unplanned buying significant amount that accounts for supermarket They studied consumers purchases. who generally shop at a leading UK retailer. The results show that consumers are aware of financial side of the shopping as three of factors (value, price awareness and loyalty have points) a financial aspect to them. Respondents felt queuing time to be more important than loyalty points".

"Mai, Jung, Lantz and Loeb (2003)investigated the impulse buying behavior of urban consumers and qualitative Vietnam. Both quantitative methods were used. They also identified personal-use and collective-use product categories. The research revealed that impulse purchases are more likely to happen with personal-use products collective-use products. They used models (impulse buying tendency and impulse frequency). The show buying results individualist orientation was positively related to impulse buying but the study did not find the negative relationship between collectivist orientation and impulse buying to be significant. Regional did influence impulse differences not really buying. The study revealed a significant negative relationship between age and impulse buying in models. The study also suggested non-linear relationship between impulse buying and income levels. Qualitative study revealed that urban consumers in Vietnam indulge in small inexpensive impulsive purchases such as clothing, and gifts. This explains music items economic transition in Vietnam has influenced consumers' attitudes, values and consumption Thus, it explains the coexistence of individualism and collectivism in individuals. Men exhibited a higher impulse buying tendency then women".

"Kacen and Lee (2002) studied the influence of culture on consumer impulsive buying behavior through a survey of consumers in the United Hong States. Australia, Kong, Singapore and Malaysia. They carried out two studies quantity the influence of culture on impulsive buying behavior of consumers. They hypothesized

that consumers who are impulsive will indulge in more frequent impulsive purchases, but this relationship will become moderate in collectivist cultures. The survey was administered to consumers in two individualistic countries States) and (Australia and the United two collectivist countries (Singapore and Malaysia). stronger results indicated a relationship between trait buying impulsiveness and impulsive buying behavior for individualists compared to The study suggested that moderates the impulse trait-behavior relationship. The results provide evidence that Asians engage in less impulse buying due to trait buying impulsiveness as compared to Caucasians. findings reveal the consistent influence of culture at both ethnicity and individual level".

"Abratt and Goodev (1990)examined occurrence of unplanned buying of non-food items South Africa. The researchers did personal face-to-face interviews with shoppers at the entry of the designated stores to form their and at intentions the exit point or check-out where actual purchases and reasons for selection weredocumented. The inconsistency between the actual purchases and the purchase intentions is then conceptualised to determine the of unplanned level and nature buying. Respondents purchased 22.5% of total non-food items unplanned purchase. The as an the purchase decisions are reveals that 48% of made in store and 41% of the respondents spend more than their expressed spending intention".

#### III. OBJECTIVES

- To find the impact of culture on impulsive buying behaviour.
- To examine the relationship between personality traits and impulsive buying behaviour.

# IV. DATA COLLECTION AND SAMPLING

"To collect the data, convenience sampling has used. The structured been questionnaire/instruments consisting sixty-six of positive items were distributed to consumers from Delhi/NCR. The questionnaire included demographic items (Gender, Age, Income. Occupation, Qualification and Income) and four sections to measure the influence culture (Individualism and Collectivism), personality (Sociableness, Pleasure Seeking Personality, Conserving, Expressive, Conscientiousness Emotional Stability) on impulse buying behaviour( and Impulse Buying Impulse Buying Tendency Frequency). In closed ended items, five point

Likert scale was used from 1-5: strongly disagree to strongly

# Culture and Personality: A Examination of Impulsive Buying Behavior of Indian Consumers

agree. The questionnaires were distributed to 258 consumers (168 online and 90 offline) and 232 responses (168)online and 64 offline) received. Out of 232 responses, responses could be considered for analysis and remaining 35 were rejected due to missing data. For measuring individualism and collectivism, the Triandis and Gelfand(1998) scale used by whereas, the used for studying influence personality, the scale used was given by and Nika(2017)".

#### **HYPOTHESES**

- Impulse Buying Behavior is significantly related to Culture-Individualism
- Impulse Buying Behavior is significantly related to culture- Collectivism
- Impulse Buying Behavior is significantly related to Expressive Personality
- Impulse Buying Behavior is significantly related to Emotional Stability

- Impulse Buying Behavior is significantly related to Sociableness
- Impulse Buying Behavior is significantly related to Pleasure Seeking Propensity
- Impulse Buying Behavior is significantly related to Conserving Personality
- Frequency of buying moderates the relationship between personality traits and impulse buying behavior
- Frequency of buying moderates the relationship between culture and impulse buying behavior.

#### **Data Analysis**

- 1. **Demographic Data:** "Out of 197 respondents, 80 were males and 117 were females. 73 respondents were in the age group of 18-30 and 63 were in 31-40 and 40 were in 41-50 whereas 11 were in the age group of 51-60 and 10 were above 60 years".
- 2. **Reliability Test:** "To test reliability, Cronbach Alpha tool was applied through SPSS on 198 respondents' data. The Cronbach Alpha value was 0.916 which means the data is 91.6% reliable and can be used for further analysis".

#### V. RESULTS AND CONCLUSION

"Consumers who are expressive and have pleasure seeking propensity, ensure higher a tendency to buy things on impulse. Thus, sellers should identify highly expressive consumers and consumers with pleasure seeking personality attract them through different color combinations to amplify the expressiveness and pleasure-seeking propensity of consumers whereas other personality attributes like emotional stability, conscientiousness conserving propensity should spoiled through various promotional strategies".

#### VI. CONCLUSIONS AND LIMITATIONS

"The sample was physically limited because the data was primarily collected from Delhi/NCR. Thus, data collected from different areas the may yield varied results. Only quantitative research method (questionnaire) was used, qualitative research methods may fetch different outcomes".
