Radio Reciprocal Membership Function on Cycle Related Graphs

S. Antony Vinodh, T. Bharathi

Abstract: Radio labeling is graph labeling which deals with nodes of a graph. A new approach fuzzy radio reciprocal labeling proposed. Fuzzy radio reciprocal labeling deals with membership function \([0,1]\) for every vertex and edge for making flexible which is stand for by \(FR^*\). Fuzzy radio reciprocal labeling is determined for fan graph and wheel graph.

Index Terms: fuzzy graph, \(\mu\) -length, \(\mu\) -distance, diameter, fuzzy labeling graph

I. INTRODUCTION

The concept of uncertainty of fuzzy set was briefed by Zadeh (1965). The fuzzy graph was defined by Rosenfield by fuzzy relation which represents the relation between the objects by previously indicating the level of relationship between the objects of the function sets [2].

II. PRELIMINARIES

A fuzzy graph \(G = (V, \sigma, \mu)\) of a nonempty set \(V\) together with a pair of function \(\sigma : V \rightarrow [0,1]\) and \(\mu : E \rightarrow [0,1]\) it satisfy \(\mu(v, u) \leq \sigma(u) \land \sigma(v)\) for all \(u, v \in V\). A path \(P\) in a fuzzy graph is a sequence of specific nodes \(v_1, v_2, \ldots, v_n\) such that \(\mu(v_i, v_{i-1}) > 0; 1 \leq i \leq n\); here \(n \geq 1\) is called the length of the path \(P\). The successive pairs \((v_i, v_{i+1})\) are called the edge of the path.

A graph \(G = (V, \sigma, \mu)\) is said to be a fuzzy labelling graph, if \(\sigma : V \rightarrow [0,1]\) and \(\mu : E \rightarrow [0,1]\) is bijective such that the membership value of lines and nodes are specific and \(\mu(v, u) \leq \sigma(u) \land \sigma(v)\) for all \(u, v \in V\) [1][2].

If \(p\) is the path consisting of the vertices \(x_1, x_2, \ldots, x_n\) in a fuzzy graph \(G = (V, \sigma, \mu)\), the \(\mu\) - length fuzzy graph is defined by \(l(p)\) where \(l(p) = \sum_{i} \mu(x_i, x_{i+1})^{-1}\). For two vertices \(x, y \in G\), the \(\mu\) - length of all paths joining \(X\) and \(Y\). The \(\mu\) - distance \(\delta(u, v)\) is the smallest \(\mu\) - length of any \(u-v\) path and \(\delta\) is metric.

\(G = (V, \sigma, \mu)\) is a fuzzy graph with the set of nodes \(V\).

Then \(e(v) = \{\text{the maximum of all the } \mu\text{-distance } \delta(u, v)\text{, for } u, v \in V\}\), where radius = minimum of \(e(v)\) and the \(v\) is the diametrical node of \(e(v) = \text{diam}(FW_n)\) [3], [6].

III. METHODOLOGY

A radio labeling \(c\) of \(G\) is an assignment of positive integers to the nodes of \(G\) satisfying
\[d(u, v) + |\gamma(u) - \gamma(v)| \geq 1 + \text{diam}(FW_n),\]
for every two specific nodes \(u\) and \(v\). The maximum integer in the range of the labeling is its span. The radio number of \(G\), \(rn(G)\), is the minimum possible span of any radio labeling for \(G\). Where \(\text{diam}(FW_n)\) is the diameter of the graph \(G\) and \(d(u, v)\) is the distance between the vertices \(u\) and \(v\) [4].

In this paper, a new fuzzy labelling of a graph is converted as a fuzzy radio reciprocal labeling. A fuzzy graph \(G = (V, \tau, \gamma)\) of a non-empty set \(V\) together with a pair of functions \(\tau : V \rightarrow [0,1]\) and \(\gamma : E \rightarrow [0,1]\) said to be a fuzzy radio reciprocal labeling for all, then the following condition satisfy
\[\delta(v, u) + \frac{1}{|\tau(v) - \tau(u)|} > \text{diam}(FW_n),\]
Where \(\delta(v, u)\) is \(\mu\) - distance of a fuzzy graph, \(\tau(u)\) and \(\tau(v)\) are membership function of nodes of \(u\) and \(v\), \(\gamma(u)\) is membership function of edges and \(\text{diam}(FW_n)\) is diameter of a fuzzy graph \(G\). Fuzzy radio reciprocal labeling is denoted by \(FR^*\). Example

![Fig.1: Fuzzy radio reciprocal labeling graph](image)

\(diam(G) = 8.3\)

\(\delta(v_1, v_2) = 8.3, \delta(v_1, v_3) = 5\)
\(e(v_1) = 8.3\)
\(\delta(v_2, v_1) = 8.3, \delta(v_2, v_3) = 3.3\)
\(e(v_2) = 8.3\)
\(\delta(v_3, v_1) = 5, \delta(v_3, v_2) = 3.3\)
\(e(v_3) = 5\)
Radio Reciprocal Membership Function on Cycle Related Graphs

When $i = 1, j = 2$

$18.3 > 8.3$

IV. RESULTS

1. Fuzzy Radio Reciprocal labelling of Fan graph

A fan graph denoted by $F_r$ is the path $P_n$, plus an extra vertex connected to all vertices of the path $P_n$ [7]. A fuzzy fan graph $G_f = (V, \tau, \gamma)$ of a nonempty set $V$ together with a pair of functions $\tau : V \rightarrow [0, 1]$ and $\gamma : E \rightarrow [0, 1]$ it satisfy

$$\gamma(v_i, v_j) \leq \tau(v_i) \land \tau(v_j)$$

for all $v_i, v_j \in V$ where $i = 1, 2, \ldots, n$ and $j = 1, 2, 3, \ldots, n$. Let $f_G$ be fuzzy fan graph. Fix $v_0$, the node adjacent to all other remaining nodes of a graph which has maximum membership function that is $\tau(v_0) = 1$. Let $P$ be the consecutive path of a cycle with nodes and adjacent with $v_0$.

In a path of the cycle, the start and end nodes are same and path $P$ contains $n - 1$ nodes which satisfies nodes $v_i, v_{i+1}, \ldots, v_{n-1}$ and adjacent with $v_0$. Construct $\tau(v_i)$, where $i$ varies from 1 to $n - 1$. Every membership function of nodes are specific and $\gamma(v_i, v_j)$ are specific, and if satisfies the following condition (i.e.) every membership function of lines always less than minimum of every pair of the nodes which adjacent to that lines.

$$\text{min}(\tau(v_i), \tau(v_j)) > \gamma(v_i, v_j)$$

Where $i$ from 1 to $n - 1$, $j$ from 1 to $n - 1$ and above proof of fuzzy fan graph admits fuzzy labeling of a graph in equation (2) and fuzzy fan graph of labeling admits fuzzy reciprocal radio labeling of graph $G_f$ , satisfies the following condition

$$\delta(v_i, v_j) + \frac{1}{\tau(v_i) - \tau(v_j)} > \text{diam}(F_{W_f})$$

(3)

Therefore fan graph satisfies all the above equation (1), (2) and (3).

Hence fan graph satisfies all the above equation (1), (2) and (3).

2. Fuzzy Radio Reciprocal labeling of Wheel graph

Wheel graph is attain from a cycle $C_n$ by adding a new vertex and edges joining it, to all the nodes of the cycle [7]. A wheel graph is called fuzzy wheel graph in which all the vertices and edges has membership function and said to satisfy

$$\gamma(v_i, v_j) \leq \tau(v_i) \land \tau(v_j)$$

for all $v_i, v_j \in V$

Fuzzy wheel graph is denoted by $F_{W_f}$.

Lemma 1.1: In any fuzzy wheel graph of $F_{W_f}$, the vertex has the maximum membership function of any fuzzy fan graph, then it has maximum incident line but not in $P_n$ path of graph $G_f$. where $n \geq 3$.

Proof: Let $G_f$ be a fuzzy fan graph, if $n = 3$ , then more than one vertices of graph $G_f$ has maximum number of incident lines. Select all the nodes of $G_f$ which has equal number of incident lines. Fix any one of the node, say $v_0$, of graph $G_f$ which has the maximum membership of the fuzzy set, if it does not belong to $P_n$ path of a graph $G_f$.

Lemma 1.2: In any fuzzy fan graph of $G_f$, the node has the maximum member function of any fuzzy fan graph, if it has maximum number of incident lines of graph where $n \geq 4$.

Theorem 1: Every Fan graph admits $FR_{L^{-1}}^f$.

Proof: Let $G$ be a Fan graph, it has lines stand for by $F_s$. Define a fuzzy fan graph $G_f = (V, \tau, \gamma)$ is a non-empty set $V$ together with a pair function $\tau : V \rightarrow [0, 1]$ and $\gamma : E \rightarrow [0, 1]$ for all $v_i, v_j \in V$

$$\gamma(v_i, v_j) \leq \tau(v_i) \land \tau(v_j)$$

(1)

and denoted by $G_f$.

Let $\phi(v_i, v_j)$ be $\mu$-distance of fuzzy fan graph and $\phi$ has the minimum $\mu$- length of $G_f$. Consider,

$$l(\rho) = \frac{1}{\phi(v_i, v_j)}$$

where $l(\rho)$ is $\mu$- length of $G_f$ and $\text{diam}(G_{W_f})$ is maximum of $\mu$- distance of graph $G_f$.

Let $G_f$ be fuzzy fan graph. Fix $v_0$, the node of a graph $G_f$ with maximum membership function of node fuzzy set, i.e., $\tau(v_0) = 1$. Let $P$ be the consecutive path of the graph set of nodes $v_1, v_2, \ldots, v_{n-1}$ and adjacent with $v_0$. Construct $\tau(v_i)$, where $i$ varies from 1 to $n - 1$. Every membership function of nodes are specific and $\gamma(v_i, v_j)$ are specific, and if satisfies the following condition (i.e.) every membership function of lines always less than minimum of every pair of the nodes which adjacent to that lines.

Where $i$ from 1 to $n - 1$, $j$ from 1 to $n - 1$ and above proof of fuzzy fan graph admits fuzzy labeling of a graph in equation (2) and fuzzy fan graph of labeling admits fuzzy reciprocal radio labeling of graph $G_f$ , satisfies the following condition

$$\delta(v_i, v_j) + \frac{1}{\tau(v_i) - \tau(v_j)} > \text{diam}(F_{W_{new}})$$

(3)

Therefore fan graph satisfies all the above equation (1), (2) and (3).

Hence fan graph satisfies all the above equation (1), (2) and (3).

Hence wheel graph satisfies all the above equation (4), (5) and (6).

Hence any wheel graph has $n$ nodes that satisfies fuzzy radio reciprocal labeling of a graph.
Algorithm of fuzzy radio reciprocal labeling of fan graph and wheel graph

Step 1: Fix \( \tau(v_0) = 1 \), \( v_0 \) has maximum number of adjacent node.

Step 2: Fix the membership function to all other remaining nodes of a graph, i.e. \( \tau(v_i) \), where \( i = 1, 2, 3 \ldots n-1 \)

Step 3: Fix the membership function to lines of a graph, i.e. \( \gamma(v_i, v_j) \), where \( i \) varies from 1 to \( n-1 \) and \( j \) from 1 to \( n-1 \), \( (i \neq j) \).

Step 4: If the following condition must satisfies

\[
\delta(v_i, v_j) + \frac{1}{\gamma(v_i, v_j)} > \text{diam}(G)
\]

If not, repeat from step 2.

Verification of fan graph

Verification of wheel graph

![Figure 3: Fuzzy radio reciprocal labeling wheel graph](image)

V. CONCLUSION

Fuzzy radio reciprocal has been introduced. Fuzzy radio reciprocal labeling for cycle related graphs have been discussed. We further extend the study on interconnection networks and cycle free graphs.
